

Alexa Thinks Ahead

Built for the Next Billion.

AI that understands your home
before you ask.

THE NEXT TEN MINUTES

From a command-taker to a *household partner.*

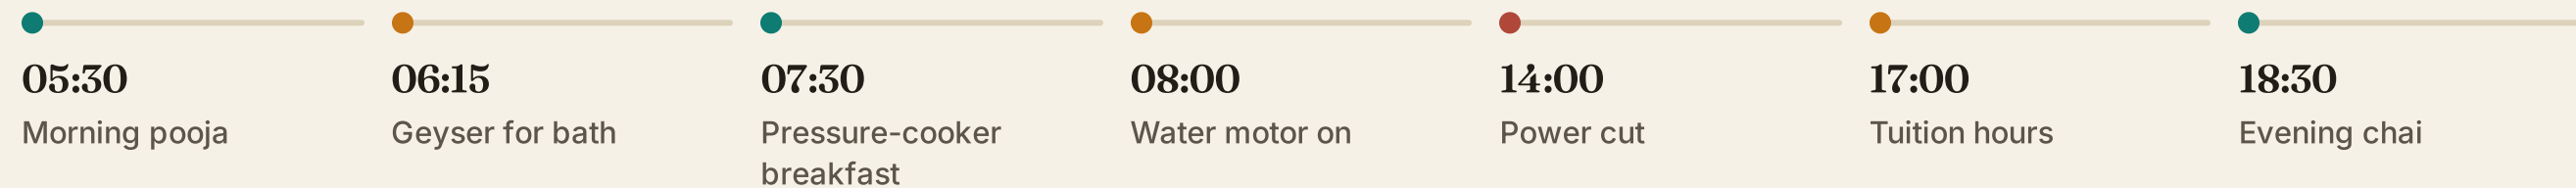

Alexa that learns the rhythm of an Indian home and acts **before** anyone asks — every action explained, every liberty earned.

THE PROBLEM

Indian homes run on rhythm. Smart homes still **wait for orders.**

“Alexa, you should already know this.” — a multi-generational household issues dozens of commands a day to devices that never learn what happens next.

Reactive, not ready

"Alexa, turn on the geyser" — every single morning. The assistant obeys, but the hot water is still 20 minutes late.

Context-blind

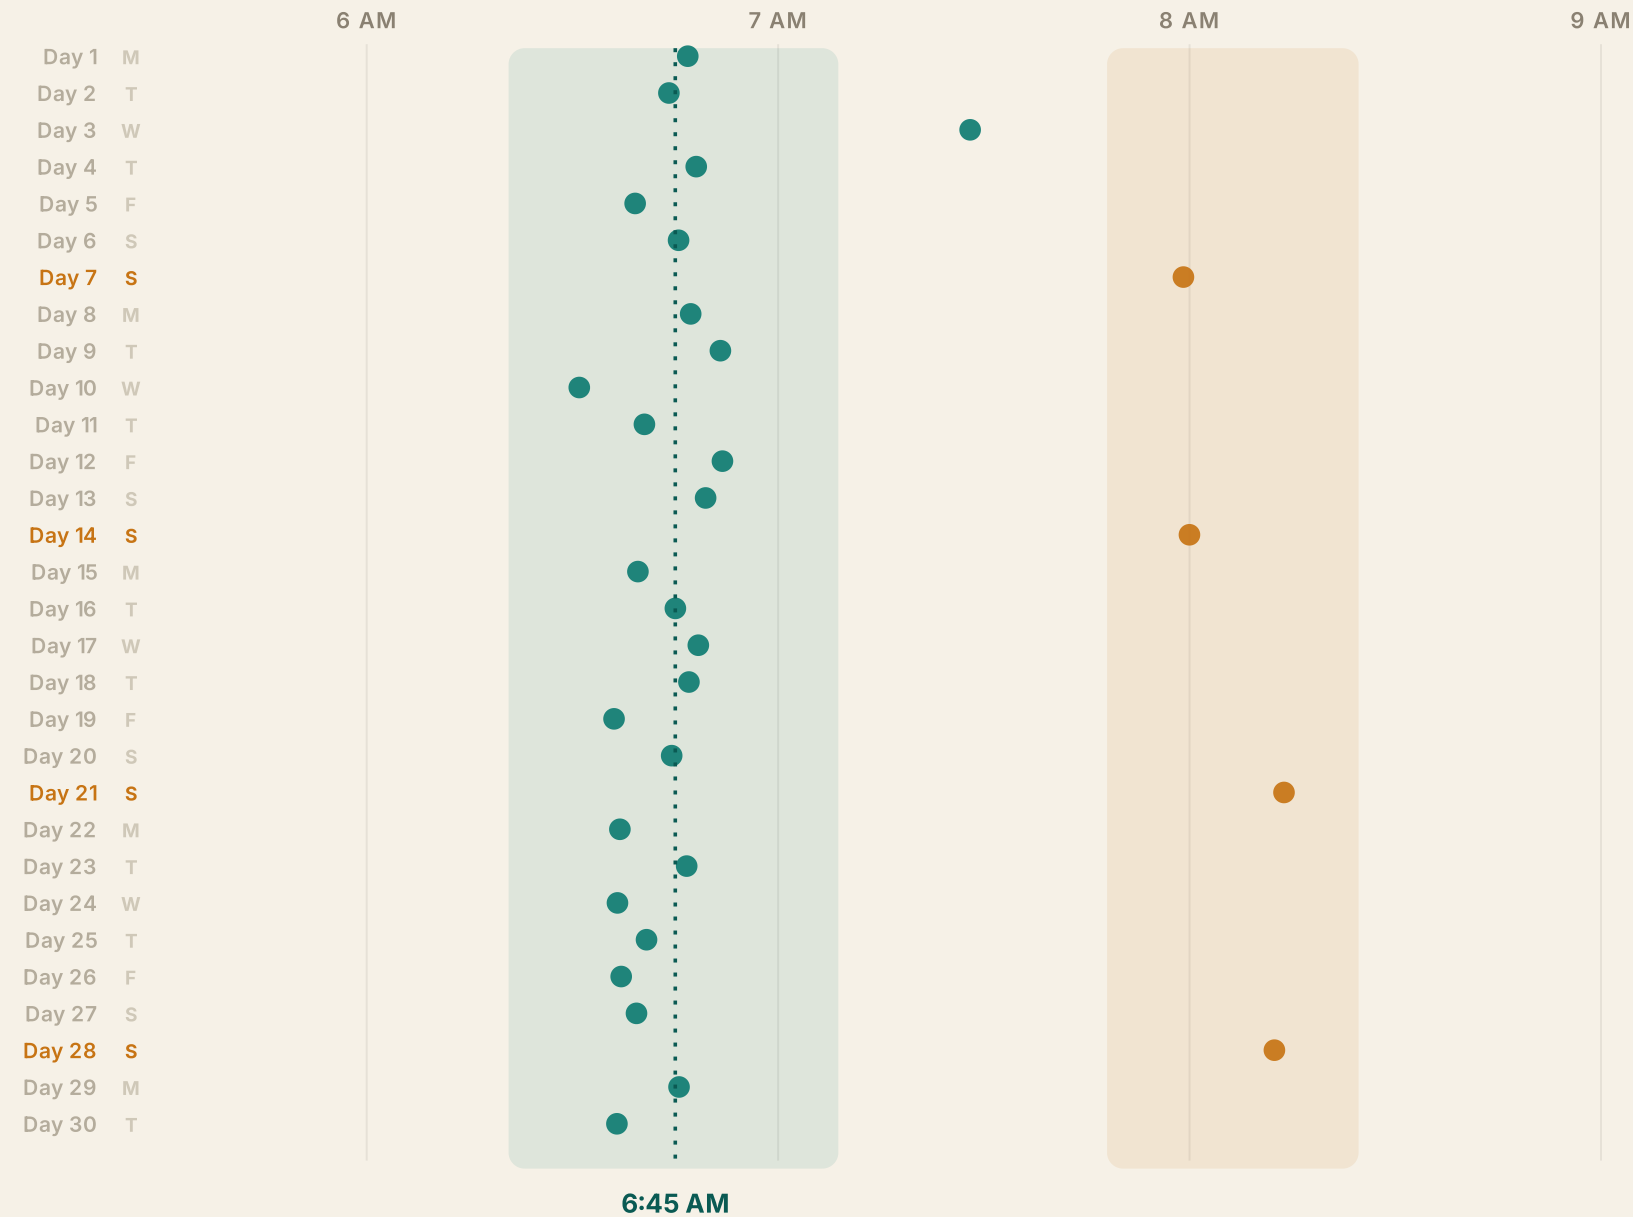

It doesn't know a power cut is different during a child's online class, or that grandparents bathe before everyone wakes.

Trust was never earned

No explanations, no way to correct it — so families keep automation switched off and do everything by hand.

THE SCENARIO — DADAJI'S BATH

30 mornings. *One pattern.*

96%

SURE ABOUT DADAJI'S BATH

- Day 14 — she's sure now. Dadaji bathes at **6:45**, every weekday.
- Sundays? **Around 8**. She knows that too.
- No one told her. She just **watched the geyser**.

Four things a family would *actually ask for*.

“It should already be ready.”

It acts ahead of the routine — the geyser is hot before the 6:45 bath, the living room is cool before Rajesh walks in. Zero commands for the daily rhythm.

“It should understand my home.”

India-first context, not hardcoded rules — pooja mornings, tariff windows, power cuts, tuition hours all ride into the reasoning as context it actually weighs.

“It should never overreach.”

Autonomy is graduated and earned — five trust tiers per device category; one override immediately lowers what it may do on its own.

“It should explain itself.”

Every action ships with a plain-language reason — "pre-heating the geyser at 05:15, the family wakes around 06:00" — and a one-tap Override.

LIVE DEMO

One day in an *Indian home*.

demo.mp4

drop the screen-recording into
deck/assets/

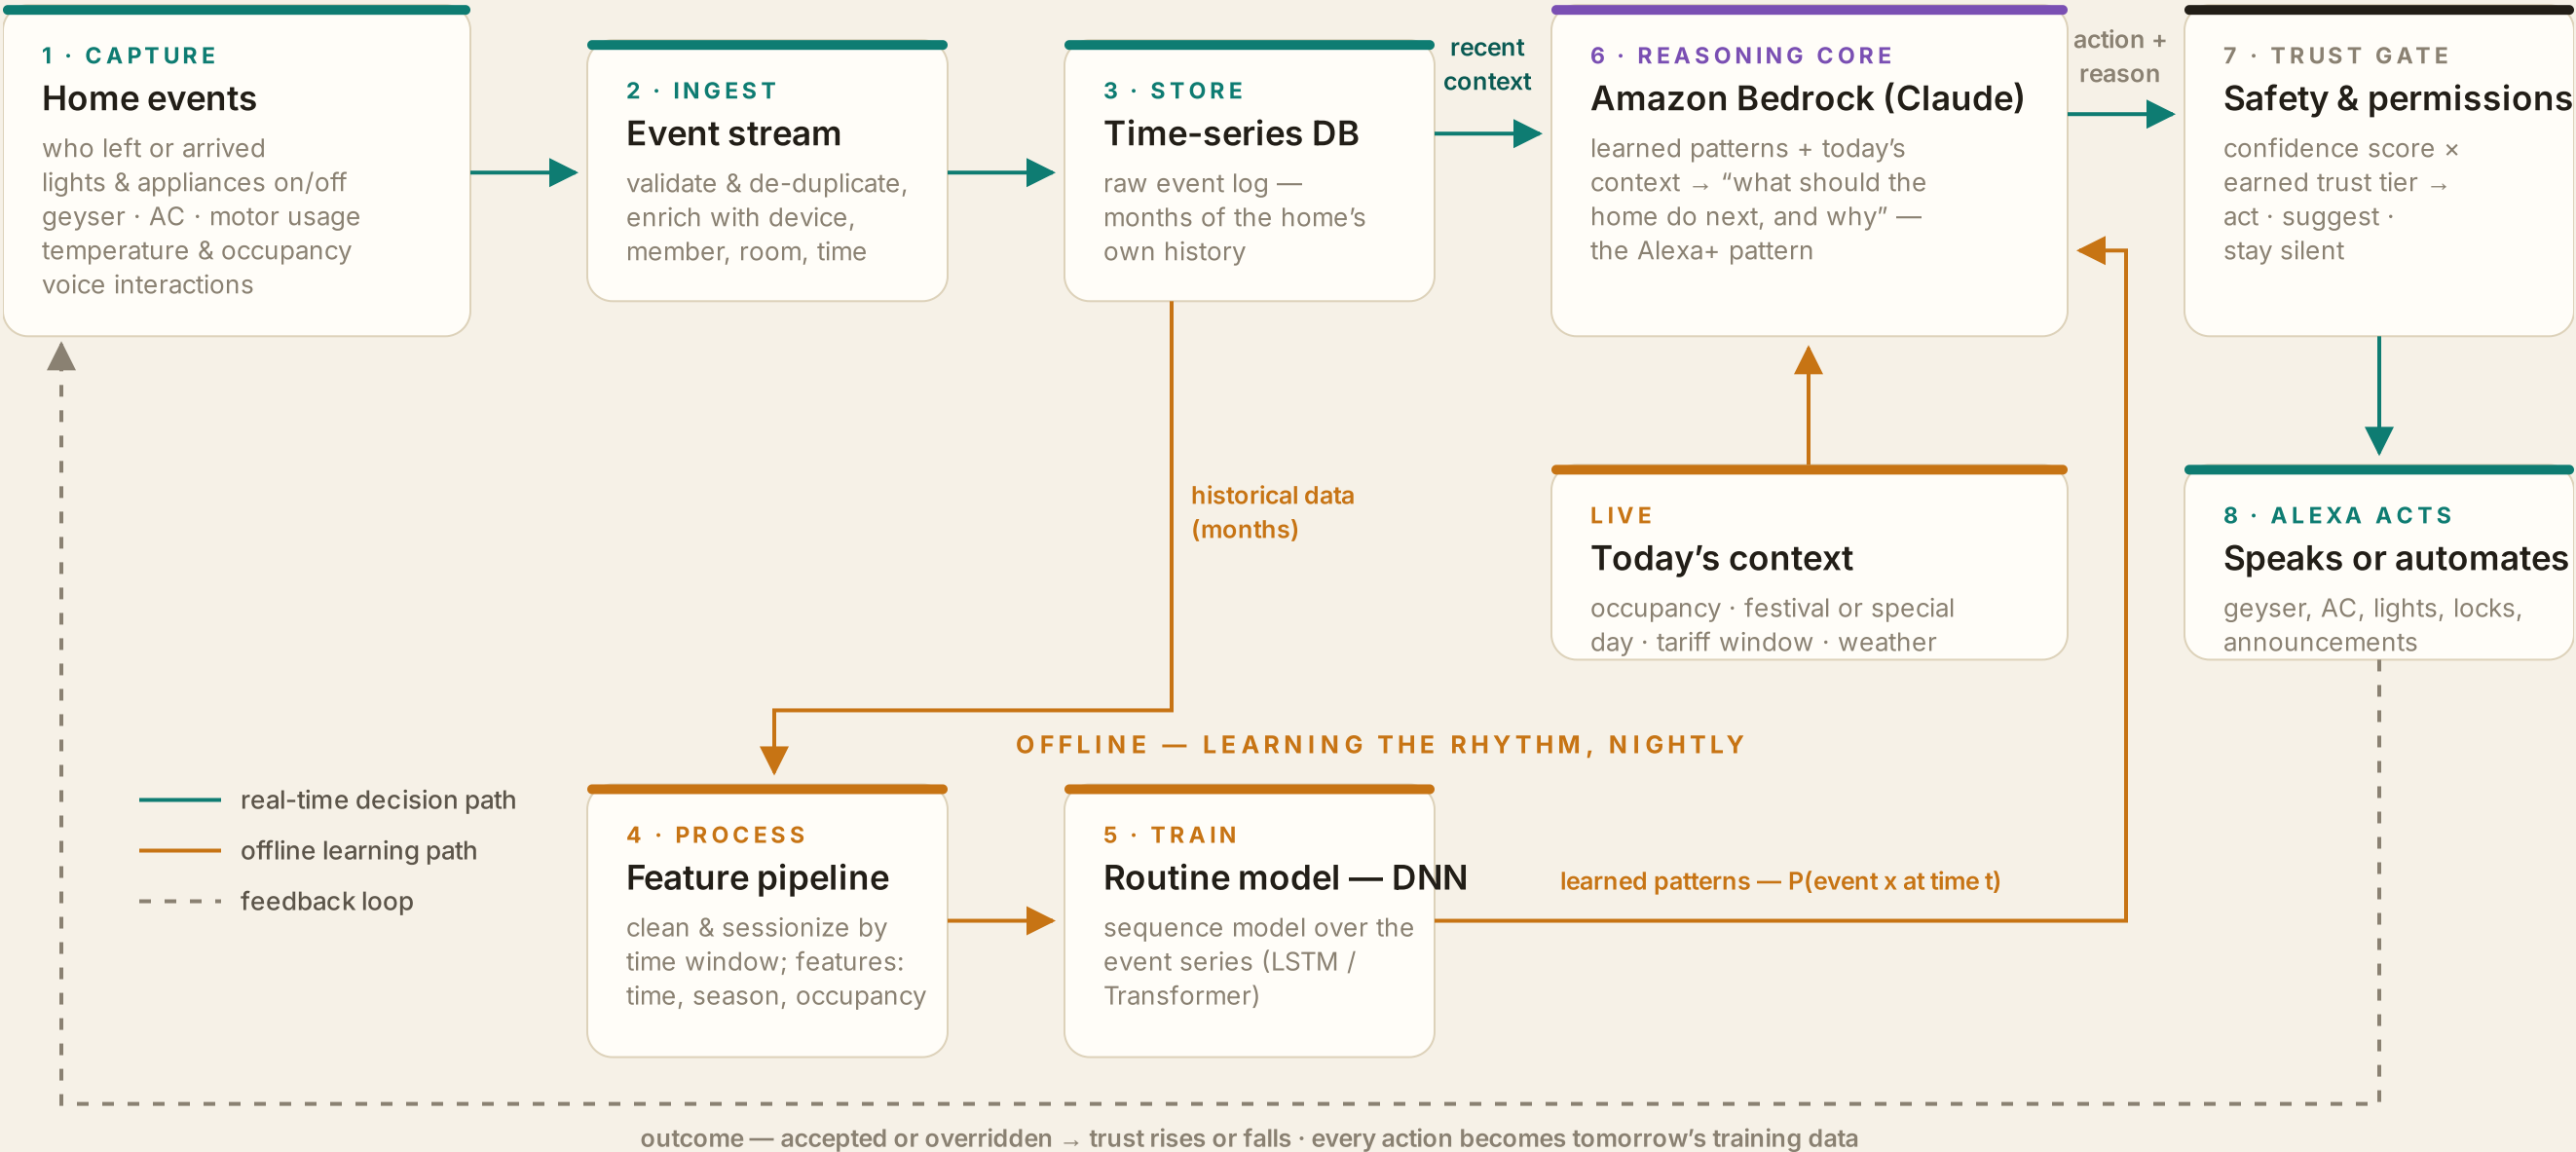

▶ 0:00 / 4:14

A routine model that knows the house, an LLM that knows *today*.

Two timescales, one decision — slow-learned trends meet today's context inside the reasoning core.

REAL-TIME — THE DECISION PATH

Built for the *next billion* homes.

~1 hour

given back to the family every day — the small chores of remembering (geyser, motor, locks, cooling) simply stop existing.

It sets itself up. Most people never open the routines tab — automation that demands configuration never gets adopted. This one configures itself, just by watching.

A power cut isn't an emergency. The inverter carries what matters — the online class, the grandparents' room — and quietly sheds the rest.

More than a speaker. For homes like these, the Echo in the living room stops being a music box and becomes the household's brain — that is what makes Alexa indispensable.

Where this goes next

Sensor fusion

Hear the pressure-cooker whistle and the water-motor hum — context from sound and power signatures, no new hardware.

Hindi & Hinglish voice

Proactive suggestions in the language the household actually speaks, member by member.

Private by default

Routine learning moves on-device; only anonymised patterns ever reach the cloud.

Beyond one home

Matter ecosystem support and society-level insight: a colony that pre-arms for the 14:00 power cut together.

THANK YOU

Questions?

An Alexa that earns trust, one morning chai at a time.
